Negin Mesgarizadeh

Date :

Fall of 2026

ABOUT ME

I was born in Tehran, in 2002, and my interest in architecture started at a young age. Although I initially entered the mathematics track because of family expectations and my academic performance, after one year I decided to change my path and study architecture instead. I was accepted into a selective public vocational school, and from around the age of sixteen, architecture became a major part of my life. I later ranked 246 in the national architecture entrance exam, studied at Shariati University College, and continued my bachelor's degree in architecture at Soore University.

Preparing for the master's entrance exam later helped me develop a much deeper interest in architectural theory, history, and the broader ideas behind design. That period changed the way I looked at architecture and became an important part of my growth as a designer. I am currently a member of the Hampa team at Markaz-e Memari. Beyond architecture, I have always been strongly drawn to art, creativity, and learning new things, and I see myself as someone who is constantly exploring new ideas and finding connections between different interests.

DESIGN PHILOSOPHY

My inspiration is not limited to architecture itself. I am interested in different cultures, art, cinema, visual storytelling, landscapes, and the way color, light, movement, and composition can affect how a space feels. I like exploring unfamiliar references and allowing each project to develop its own character rather than forcing every design into the same aesthetic. This freedom to move between different influences is something I want to keep as I continue developing my own design language.

My design philosophy is still evolving, and I see that as an important part of my identity as a designer. I do not want to define myself through one fixed style or visual language. Sometimes I am drawn to minimal, quiet, and restrained spaces, while at other times I am fascinated by color, texture, detail, and more expressive compositions. There are also moments when I want to bring several of these qualities together. For me, this variety comes from curiosity and from wanting to experiment with different ways of creating atmosphere and experience.

I am deeply interested in architectural history, traditional buildings, and the way different cultures have shaped space over time. I enjoy looking at how people lived, how climate influenced design, and how materials, ornament, and local traditions created a strong sense of identity. At the same time, I am equally fascinated by technology and the future of architecture. I like the idea of learning from the past without simply repeating it, and using contemporary tools and methods to reinterpret those ideas in new ways.

SKILLS & EXPERTISE

ARCHITECTURAL DESIGN

Developing architectural concepts, spatial organization, plans, sections, and design solutions with attention to context, user experience, and visual identity. I enjoy exploring different design approaches rather than working within one fixed style.

DIGITAL DESIGN & VISUALIZATION

Experience working with Revit, AutoCAD, Enscape, and digital presentation tools, with a growing focus on Rhino, post-production, and more advanced visualization workflows. I am especially interested in combining design with new digital technologies.

RESEARCH & DESIGN THINKING

Strong interest in architectural history, theory, culture, and contextual research. I enjoy studying the ideas behind architecture and using research as part of the design process rather than treating it as a separate stage.

VISUAL COMMUNICATION & CREATIVE DIRECTION

Creating architectural presentations, diagrams, concept boards, and visual narratives that clearly communicate a project's idea and atmosphere. My broader interest in art, cinema, color, composition, and storytelling also influences the way I present and develop design work.

AUTISM SCHOOL

This project was developed as my final university project and focuses on designing a supportive learning environment for children with autism. The design emphasizes clear spatial organization, controlled sensory stimulation, natural light, acoustic comfort, and access to quiet and outdoor spaces. The aim was to create a school that feels safe, understandable, and flexible while supporting learning, independence, and social interaction.

Architectural design of a
Autism school

Professor: Dr. Amirreza Yaghobi

The spatial design avoids sharp geometric angles, instead prioritizing soft curves and clear, predictable pathways to eliminate visual anxiety. The color palette relies strictly on soothing "subdued and muted" tones—such as soft blues, pastel greens, and neutral beige—which naturally lower heart rates and prevent sensory overload (Hyper-stimulation), creating a serene and stabilizing learning environment

In addition to the use of calming colors and gentle spatial forms, natural lighting and carefully selected materials play a significant role in enhancing the learning environment. Large windows maximize daylight while minimizing glare, creating a comfortable visual experience. Acoustic treatments reduce distracting noise, allowing children to focus without becoming overwhelmed

Flexible furniture with rounded edges supports both safety and adaptability, enabling educators to organize spaces according to different learning activities

Expeloded Diagram

Site Analysis

The site in the Pasdaran area of Tehran benefits from a diverse and dynamic microclimate with significant seasonal variation, offering strong solar potential, clear wind circulation patterns, and a wide thermal range that enrich environmental responsiveness throughout the year

The organization of space should provide a clear hierarchy between active and quiet zones, allowing children to transition smoothly between different activities. Clearly defined functional areas reduce uncertainty and help users understand the purpose of each space. This structured layout enhances independence, minimizes confusion, and supports a sense of security throughout the learning environment

Sensory-sensitive design emphasizes the careful control of environmental stimuli. The use of sound-absorbing materials, indirect lighting, and non-reflective finishes helps reduce unnecessary sensory input. By minimizing distractions, the environment becomes more comfortable for children who are highly sensitive to visual, auditory, or tactile stimulation

Biophilic design elements, such as indoor plants, natural textures, and visual connections to outdoor landscapes, contribute to psychological well-being and emotional regulation. Exposure to natural features has been associated with reduced stress, improved concentration, and increased feelings of comfort, making these elements valuable additions to educational environments

Furniture should be designed with safety, flexibility, and accessibility in mind. Rounded edges, adjustable seating, and lightweight movable furniture enable educators to adapt classrooms for different learning activities while maintaining a safe and inclusive environment. Flexible layouts also encourage collaborative learning without compromising personal space

This project focuses on the design of a specialized, responsive school for children with Autism Spectrum Disorder in the Pasdaran neighborhood of Tehran

Utilizing 'Sensory Architecture' principles, the design redefines space as an active therapeutic tool. By filtering overwhelming environmental stimuli, implementing strict sensory zoning, and creating dedicated 'escape spaces,' this project establishes a safe and predictable environment that fosters learning, unlocks innate creativity, and paves the way for social integration."

Willowbrook is a residential complex located in Tehran, south of Modiriat Bridge and adjacent to Imam Sadegh University. The project includes six different apartment types, ranging from approximately 60 to 300 square meters, designed to accommodate different lifestyles, from young couples to larger families. Alongside the residential units, the complex offers a variety of shared facilities and amenities intended to support an active and social community. Landscape design played an important role in the project, with green spaces, pedestrian paths, recreational areas, and sports facilities such as a tennis court integrated throughout the site. The main goal was to create a comfortable residential environment where architecture, landscape, and communal spaces work together to improve everyday living.

Willowbrook was envisioned as a peaceful sanctuary amid the hustle and bustle of Tehran. The name reflects the core idea behind the project – a calm, green place where life flows gently like a quiet brook surrounded by elegant willow trees. Designed to promote a harmonious lifestyle, the complex features six residential buildings with various unit types, shared service areas, and thoughtfully landscaped open spaces. All architectural elements, from plans to interior design, were developed in Revit to ensure a balance between aesthetic quality and functional living, bringing tranquility and comfort to urban life.

The Vacation House is an academic residential project designed for a seven-member, three-generation family on a riverside site in Karaj. The design balances privacy with togetherness, combining independent living areas with shared spaces for gathering and recreation. Stepped volumes, curved terraces, a landscaped garden, and a pool create opportunities for outdoor living while connecting the home to its surroundings.

THE VACATION HOUSE

THE VACATION HOUSE

THREE GENERATIONS ONE SHARED RETREAT

A riverside family retreat in Karaj. The project explores a balance between independent living, shared rituals and life outdoors.

DESIGN CONCEPT

01 Together + apart

Three family groups, with shared places to gather.

02 Connected outdoors

Terraces and garden spaces extend daily life outside.

03 A layered home

Stepped volumes create distinct outdoor rooms.

SOLAR RESPONSE

Approx. solar-noon altitude at 35.8°N; south-facing section. Geographic study, not site orientation.

REGIONAL WIND

Prevailing wind: from NW. Karaj station study, 2004-2015. River-valley airflow may differ; site north remains unverified.

OLD TOWN HOTEL

Old Town Hotel is a conceptual redesign project located in Marrakech. The original hotel was strongly influenced by local Moroccan culture, while my approach was to reinterpret the space through the architectural language of the Renaissance.

The redesign introduces Renaissance-inspired proportions, symmetry, arches, decorative details, classical references, and a richer material palette throughout the interiors and shared spaces. The main idea was to transform the identity of the hotel while preserving its sense of character, creating a dialogue between the existing setting of Marrakech and the elegance, order, and visual richness associated with Renaissance architecture.

OLD TOWN HOTEL

Plans

Inspired by the classical orders, Renaissance architects employed precise mathematical ratios and geometrical forms to create harmonious designs.

Renaissance architecture, spanning from the 14th to the 17th century, marked a revival of classical antiquity and a shift from Gothic styles to a renewed emphasis on symmetry, proportion, and geometry inspired by ancient Roman and Greek ideals. Key characteristics of this period include harmonious designs with precise mathematical ratios, the use of columns from the classical orders (Doric, Ionic, and Corinthian), semi-circular arches, and iconic domes.

Doors and Windows

Renaissance buildings featured large, arched windows and grand entrances, often with elaborate frames and pediments.

Arches and Domes

Semi-circular arches and domes became prominent, enhancing the grandeur and spatial harmony of buildings.

Materials

The use of high-quality materials like natural stone, sand stone, along with a palette of warm, earthy tones, brings authenticity to the Renaissance aesthetic.

Columns

The use of columns (Doric, Ionic, and Corinthian) and pilasters was a defining feature, adding both structural and aesthetic value.

Negin Mesgarizadeh
Ghazaleh Ramezani

Decorative elements such as friezes, cornices, and intricate moldings, along with large, arched windows and grand entrances, define Renaissance buildings. Influential architects like Filippo

PROCESS & WORKFLOW

I begin by exploring the brief, the site, and the people who will use the space. Through research, sketches, and mood boards, I develop ideas and test them through drawings and digital models. I refine the layout, form, and materials together, then use rendering and post-production to communicate the design clearly. Throughout the process, I value feedback, attention to detail, and thoughtful time management.

SKETCHES & EXPLORATIONS

THANK YOU

I look forward to opportunities to learn, contribute, and grow through thoughtful design and collaboration.
